6. Remarks and comments

1. According to the applicant declaration, the device AX211NGW operating in BLE mode is non adaptive equipment so it is considered as receiver category 2.
2. At customer request, the testcases 4.3.2.7 & 4.3.2.8 were carried out at higher Tx Power: +3dB vs nominal declared power.

7. Test Verdicts summary

The statement of conformity to applicable standards in the table below are based on the measured values, without taking into account the measurement uncertainties.

Annex A. Test & System Description

A.1 Measurement System

According to clause 4.2.1 the manufacturer declared that Bluetooth LE on this device doesn't qualify for FHSS, but instead to non-FHSS equipment. Measurements were performed using the following setups and made in accordance to the general provisions of EN300 328 v2.2.2 agreeing to the requirements in clause 4.3.2.

Rohde & Schwarz TS8997 system with the switching unit OSP120, OSP B-157 and software WMS32 were employed. The DUT was installed in a test fixture and then connected to a laptop computer and AC/DC power adapter. The laptop computer was used to configure the EUT to continuously transmit at a specified output power using the Intel proprietary tool DRTU.

Setups for conducted and radiated measurements are shown below.

Radiated test setup

Radiated Setup 30 MHz - 1 GHz (Transmitter tests)

Radiated Setup 1 GHz – 6.4 GHz (Transmitter tests)

Radiated Setup 6.4 GHz – 12.75 GHz (Transmitter tests)

Radiated Setup 30 MHz - 1 GHz (Receiver tests)

B.1 Test Conditions

ETSI clause	Conditions	ETSI EN 300 328 v2.2.2 Annex E
5.1.2.1	The normal temperature and humidity conditions for tests shall be any convenient combination of temperature and humidity within the following ranges: • Temperature: +15 °C to +35 °C; • Relative humidity: 20 % to 75 %.	 “Information provided by the customer”
5.1.2.2	The normal test voltage for the equipment shall be the nominal voltage for which the equipment was designed.	
5.1.3	Some tests in the present document need to be repeated at extreme temperatures. Where that is the case, measurements shall be made over the extremes of the operating temperature range as declared by the manufacturer.	

B.2 RF output power

Test limits

ETSI clause	Limits
4.3.2.2.3	For non-adaptive non-FHSS equipment, where the manufacturer has declared an RF output power of less than 20 dBm e.i.r.p., the RF output power shall be equal to or less than that declared value. This limit shall apply for any combination of power level and intended antenna assembly.

Test conditions

ETSI clause	Conditions
5.4.2.1	The measurements for RF output power shall be performed at both normal environmental conditions and at the extremes of the operating temperature range. For equipment using wide band modulations other than FHSS, the measurement shall be performed at the lowest, the middle, and the highest channel on which the equipment can operate.

Test procedure

The conducted setups shown in section

Test & System Description were used to measure the RF output power. The antenna terminal of the EUT is connected to the OSP120 through a 10dB attenuator and a cable. System connection cable loss is compensated by the WMS32 software

Antenna gain is taken in account and added by the software to the measurements. The EIRP power (dBm) is calculated by adding the declared maximum antenna gain to the measured conducted power.

B.3 Power Spectral Density

Test limits

ETSI clause	Limits
4.3.2.3.3	The maximum Power Spectral Density for non-FHSS equipment is 10 dBm per MHz.

Test conditions

ETSI clause	Conditions
5.4.3.1	These measurements shall only be performed at normal test conditions. The measurement shall be repeated for the equipment being configured to operate at the lowest, the middle, and the highest frequency of the stated frequency range. For the duration of the test, the equipment shall not change its operating frequency.

Test procedure

The conducted setup shown in section

Test & System Description was used to measure the power spectral density (PSD) accordingly to the test method described in ETSI EN 300 328 v2.2.2 §5.4.3.2.1. The antenna terminal of the EUT is connected to the OSP120 through a 10dB attenuator and a cable, the spectrum analyzer is connected to the receiver port on the OSP. System connection cable loss is compensated by the WMS32 software to measure all parameters.

Antenna gain is taken in account and added by the software to the measurements. The EIRP power (dBm) is calculated by adding the declared maximum antenna gain to the measured conducted power.

Test conditions

ETSI clause	Conditions
5.4.7.1	These measurements shall only be performed at normal test conditions. In case of conducted measurements on smart antenna systems (equipment with multiple transmit chains) measurements need only to be performed on one of the active transmit chains (antenna outputs). The measurement shall be performed only on the lowest and the highest frequency within the stated frequency range. If the equipment can operate with different Nominal Channel Bandwidths (e.g. 20 MHz and 40 MHz), then each channel bandwidth shall be tested separately.

B.5 Transmitter unwanted emission in the out-of-band domain

Test limits Test limits

ETSI clause	Limits
4.3.2.8.3	The transmitter unwanted emissions in the out-of-band domain but outside the allocated band, shall not exceed the values provided by the mask below  A: -10 dBm/MHz e.i.r.p. B: -20 dBm/MHz e.i.r.p. C: Spurious Domain limits <i>BW = Occupied Channel Bandwidth in MHz or 1 MHz whichever is greater</i>

Test conditions

ETSI clause	Conditions
5.4.8.1	These measurements shall only be performed at normal test conditions. For non-FHSS equipment, the measurement shall be performed at the lowest and the highest channel on which the equipment can operate. These operating channels shall be recorded. The equipment shall be configured to operate under its worst case situation with respect to output power. If the equipment can operate with different Nominal Channel Bandwidths (e.g. 20 MHz and 40 MHz), then each channel bandwidth shall be tested separately.

Test procedure

The conducted setup shown in section

Test & System Description was used to measure the unwanted emissions in the out of band domain accordingly to the test method described in ETSI EN 300 328 v2.2.2 §5.4.8.2.1. The antenna terminal of the EUT is connected to the OSP120 through a 10dB attenuator and a cable, the spectrum analyzer is connected to the receiver port on the OSP. System connection cable loss is compensated by the WMS32 software on measured parameters.

Antenna gain is taken into account and added by the software to the measurements.

WMS32 provides the mask and the frequency limits based in the measured channel bandwidth. Maximum values for each limit level (-10dBm and -20dBm) are pointed using markers.

B.6 Transmitter unwanted emissions in the spurious domain**Test limits**

ETSI clause	Limits
4.3.2.9.3	The transmitter unwanted emissions in the spurious domain shall not exceed the values given in table below. For emissions radiated by the cabinet or emissions radiated by integral antenna equipment (without antenna connectors), these limits are e.r.p. for emissions up to 1 GHz and as e.i.r.p. for emissions above 1 GHz

Test conditions

ETSI clause	Conditions
5.4.9.1	These measurements shall only be performed at normal test conditions. For non-FHSS equipment, the measurement shall be performed at the lowest and the highest channel on which the equipment can operate. The equipment shall be configured to operate under its worst case situation with respect to output power. If the equipment can operate with different Nominal Channel Bandwidths (e.g. 20 MHz and 40 MHz), then the equipment shall be configured to operate under its worst case situation with respect to spurious emissions.

Test procedure

The radiated setups (transmitter) shown in section

Test & System Description were used to measure the transmission spurious emissions accordingly with ETSI EN 300 328 v2.2.2 § 5.4.9.2.2. Depending of the frequency range and bands being tested, different antennas and filters were used; in consequence different setups are employed.

The final measurement is done by varying the antenna height from 1 to 4 meters, the EUT azimuth over 360° and for both Vertical and Horizontal polarizations.

The radiated spurious emission was measured on the worst case configuration on the low and high channel for each transmission mode.

Tx Spurious emission was carried out initially at Maximum Conducted Power

B.8 Receiver Blocking

Test limits

ETSI clause	Limits								
4.3.2.11.3	For equipment that supports a PER or FER test to be performed, the minimum performance criterion shall be a PER or FER less than or equal to 10 %.								
4.3.2.11.4	While maintaining the minimum performance criteria as defined in clause 4.3.2.11.3, the blocking levels at specified frequency offsets shall be equal to or greater than the limits defined for the applicable receiver category provided in table below. Receiver blocking parameters for Receiver Category 2 equipment <table><tr><th>Wanted signal mean power from companion device (dBm) (see notes 1 and 3)</th><th>Blocking signal frequency (MHz)</th><th>Blocking signal power (dBm) (see note 3)</th><th>Type of blocking signal</th></tr><tr><td>$(-139 \text{ dBm} + 10 \times \log_{10}(\text{OCBW}) + 10 \text{ dB})$ or $(-74 \text{ dBm} + 10 \text{ dB})$ whichever is less (see note 2)</td><td>2380 2504 2300 2584</td><td>-34</td><td>CW</td></tr></table> NOTE 1: OCBW is in Hz NOTE 2: In case of radiated measurements using a companion device and the level of the wanted signal from the companion device cannot be determined, a relative test may be performed using a wanted signal up to $P_{\text{min}} + 26 \text{ dB}$ where P_{min} is the minimum level of wanted signal required to meet the minimum performance criteria as defined in clause 4.3.1.12.3 in the absence of any blocking signal. NOTE 3: The level specified is the level at the UUT receiver input assuming a 0 dBi antenna assembly gain. In case of conducted measurements, this level has to be corrected for the (in-band) antenna assembly gain (G). In case of radiated measurements, this level is equivalent to a power flux density (PFD) in front of the UUT antenna with the UUT being configured/positioned as recorded in clause 5.4.3.2.2. Test conditions

ETSI clause	Conditions
5.4.11.1	These measurements shall only be performed at normal test conditions. For non-FHSS equipment, having more than one operating channel, the operating channels on which the testing has to be performed shall be selected as follows: • For testing blocking frequencies less than 2400 MHz, the equipment shall operate on the lowest operating channel. • For testing blocking frequencies greater than 2500 MHz, the equipment shall operate on the highest operating channel. Equipment which can change their operating channel automatically (adaptive channel allocation), and where this function cannot be disabled, shall be tested as a FHSS equipment. If the equipment can be configured to operate with different Nominal Channel Bandwidths (e.g. 20 MHz and 40 MHz) and different data rates, then the combination of the smallest channel bandwidth and the lowest data rate for this channel bandwidth which still allows the equipment to operate as intended shall be used. This mode of operation shall be aligned with the performance criteria defined in clause 4.3.1.12.3 or clause 4.3.2.11.3 and shall be described in the test report..

Test procedure

The receiver blocking setup shown in section

Test & System Description was used to measure receiver blocking signal. The signaling Unit is a CMW500.

The packet error rate (PER) is measured with the CMW500. The blocking signal is emulated by the Signal generator SMB100A. Antenna gain and insertion loss are taken into account.
